We offer service on all types of tire pressure monitoring systems. There are two types of systems in use today. Direct monitoring uses tire pressure sensors in the wheel that report to a computer. Indirect is a system that uses wheel speed sensors to infer tire pressure and has no actual pressure sensor. Below are images of one of our tools for testing and programming and the other is the indicator you may see on your dash that may indicate low pressure or a system problem. Always feel free to stop in if you need your pressure checked.
